

ABSTRACT

On new page 11, please insert the following Abstract:

In order to reduce the required separating and suction forces on the operational handpiece (1), the slit of the nozzle (8) is inclined at an angle (A) in relation to the plane of the axis of the injection cannula (5) and the angle (A) is selected in such a way that a flat liquid jet (9) is formed with at least one separation tip (10) and a first separation edge (11), in addition to a second separator edge (12), and a separator surface (13).
